SUN-MAR – Pool-Side Toilets

How a SUN-MAR Works

SUN-MAR Uses a Unique Three Chamber Approach to Composting.

The 1st Chamber

The composting itself takes place in a patented Bio-drum™ which tumbles to optimize mixing, oxygenation and moisture distribution. Excess liquid automatically passes through a screen in the rear of the Bio-drum™ directly into the evaporating chamber.

The 2nd Chamber

Excess liquid, if any, is evaporated from a separate evaporating chamber which is the floor of the unit (below the Bio-drum™ and under the finishing drawer). This large surface area, is heated by a thermostatically controlled heater in a sealed base compartment underneath the evaporating chamber.

Air is pulled by the fan over this warmed evaporating surface and up the vent stack. Under normal circumstances the unit will evaporate all excess liquids, but where an overload condition is expected, the safety drains at the rear should be connected to a container.

The 3rd Chamber

Composting is completed in the finishing drawer at the front of the unit. By rotating the drum backwards, compost drops into the drawer, where it is isolated from new fresh material and need not be emptied until more compost is to be extracted.
